

Carbon Emissions Reduction Policy for Armenian International Airports

Sustainable business activity is fundamental to Armenian International Airports (AIA's) ability to meet the challenges of the future, and to grow and compete in the region.

We have a similar commitment to carbon emissions management. We believe that controlling and reducing carbon emissions contributes positively to environmental sustainability and aligns with our energy and fuel management approach.

We are committed to minimize carbon emissions by maximizing environmental awareness and energy efficiency in a continual improvement cycle in order to provide an environmentally-responsible, safe and comfortable environment for our operations.

Our guidelines include:

- Reduce environmental impact, with specific attention to saving natural resources: paper, water, electricity, and fuel.
- Promote environmental awareness and responsibility among our employees to reduce waste and encourage initiatives.
- Consider environmental impact on choices when initiating projects
- Review and continuously improve carbon management with the objective to reduce CO2 emissions by using energy efficient equipment, renewable sources and systematic monitoring and assessment of energy consumption and effectiveness of our measures.
